What's Better; Public or Private Transport?

While there are certainly a couple of reasons why people prefer **private** transport, it's hard to deny that there are also a variety of benefits that come with using **public** transportation.

Each has its own set of pros and cons, and while the choice will often come down to personal preference, it's well worth considering the key points of both if you want to find the best one for you.

Benefits of **public** transport

Most will find that one of the biggest benefits of using **public** transport is that it can be a far more cost-effective way to get around. This alone can be enough to convince many people to choose it. Often, you can save on petrol and just general maintenance by only having to pay your fare.

It also requires less effort, since you won't have to worry about actually driving to your **destination** yourself.

For the environmentally conscious, since many people can ride in the same vehicle rather than several individual ones, this is a much more worthwhile option. Public transport can help to reduce emissions and overall improve air quality, as well as so much more.

Benefits of **private** transport

When you're in your own vehicle, you're in control. You can decide on where you go, whenever you want. Having the freedom and flexibility is easily one of the biggest advantages of **private** transport – and for plenty of people, this is a necessity. Even with the costs and extra work that comes with owning your own vehicle, for some, it's more than worth it.
